

Data Set - <https://shorturl.at/AaTYM>

1. Append the sales data from two separate tables into a single table in Power Query Editor.
2. Use Power Query Editor to:
 - Remove blank rows (If any)
 - Remove any duplicate rows
 - Remove any unwanted columns
 - Rename columns to descriptive names
3. Handle the date column and change the datatype of that column to "Date".
4. Drop the "Time" column and change the "cogs" column to "Cost of Goods Sold".
5. Duplicate the "Date" column and split the original date column into three separate columns: "Year", "Month Name" (January, February etc), and "Day".
6. Create a new column name "Price Before tax" which will be equal to "Quantity" * "Unit Price". (Now you figured out that the "Price Before tax" is equal to "Cost of goods sold" so drop the "Cost of goods sold" column)
7. Round up all the numerical(float) columns to 2 decimal places.
8. Change the Branch name from A, B, and C to Ahmedabad, Bangalore and Chennai respectively
9. Load the cleaned and transformed data into PowerBI Desktop and create a visual that will represent the total percentage sales for each Branch out of the total sales.
10. Visualize the gross income across different cities.

Additional:

Create a bar chart to show the count of orders placed by the customers in different product

lines. Also, change the color of the bar to 'Red". Give the appropriate title to the visualization.
